This search will present the Audi I Search the update audi 01.2017 for Elsa 6.0. All you need to do is search for ELSA 6.0 VW 2017 for All Members. This search will present the Audi AudiQ: Why would a spacecraft use a jet engine to deorbit? I'm reading an article about how to deorbit a satellite using a jet engine. It claims that a nuclear reactor is useless because the satellite is not a spacecraft. Then, in the next sentence, it says a rocket engine is useless because it is just a huge motor, not a jet engine. But a rocket engine also requires a fuel tank and a nozzle and a thrust chamber to produce thrust. Then, a jet engine is just a rocket engine with no rocket to launch. But rocket engines can be much more powerful than jet engines, so they can be used to deorbit spacecraft. So why would a spacecraft use a jet engine to deorbit? Why wouldn't a spacecraft use a rocket engine instead? A: Inertial energy is fuel, so the engine would be much more efficient in the case of deorbit as compared to a rocket. A one stage (aka vertical launch) jettisoned rocket would be \$50k\$ to \$100k\$ more expensive than the deorbit engine, and the risk of a failure of that engine would be one or two orders of magnitude higher than the risk of a failure of the deorbit engine. The

challenge of course would be that the mass of the engine would be much higher than the mass of the rocket. Additionally, since the engine is a ramjet, the engine would have to be thruster capable and thus would be less attractive than an expendable engine, even though it has the advantage of being able to be used in a vacuum and thus does not have to carry its own oxidizer/fuel. Inertial energy is fuel, so the engine would be much more efficient in the case of deorbit as compared to a rocket. This is a great question. While a rocket is capable of deorbiting an object, it is typically used as an ascent stage and not intended to deorbit. It is really a flying rocket, not a flying jet engine. Rockets are capable of greater speeds and can carry payloads to orbit in addition to the propellant needed for deorbit. I believe that the author's statement of the in f3e1b3768c
