Geomagic Studio 2012 available for download as a personal/home edition and a professional CAD/3D package containing a CAD/CAE package in english and in french, russian, german, dutch, italian, poland, russian, spanish, arabic, portuguese. a survey to my customers. A: First some terminology: Scan is, as you know, the process of reconstructing a 3D model from data Probe is a type of scan that collects color or black & white patterns Scan is good for 3D modeling and printing, but not for CAD. Probe is good for CAD. Source Scan: Scan does not "convert" colors into a CAD surface, but instead provides a "surface" for you to put your CAD data into. You might need to do some conversion yourself, depending on the colors and how you want the CAD data to be displayed. All of the Scan software I've used has had some sort of built in conversion utility. 3DScan is a popular Scan software, and you can find it at many software retailers. Probe: Probe will scan as well as other surfaces, but the value of it is that you can modify the color afterwards. ScanUp Pro is a popular Probe software and you can find it at many software retailers. For software comparison, I recommend that you look at asstech's software table. The software names are there, as well as a good description of each software. Here's some more information on Scan: And here's more information on Probe: The southern distribution of the house martin: population response to breeding area. The house martin is one of the most abundant birds in UK gardens and their ability to recolonise areas following disturbance in the breeding area has been demonstrated. However, the relative importance of demography and dispersal in regulating southern boundary shifts of house martins is unclear. Here, we review studies that have estimated the breeding distribution of house martins in the UK and compare this with their population estimates for the year 2007. The majority of studies estimate that house martins breed in south eastern England, W England and the West Midlands,
