Run the Autocad *.exe file using the command line and start the application. (See also: How to install Autodesk Autocad) You will be prompted for a login. Enter your Autocad registration and password. Once logged in, select File | Import | Import from File... and then select from the Open window. Then navigate to the batch file. In this case the batch file is at

C:\Users\[your_username]\AppData\Roaming\Autodesk\AutoCAD_2017\2017\en_us\macros\[your_batch_file]

Choose Open and select the autocad.bat file. Check and the batch file is created. Exit the application and select File | Exit from the Autocad menu. Create multiple instances Now that you've created a batch file to create a single instance of the application, you should now create multiple instances of Autodesk Autocad. To do so, run the batch file for each instance you want. The following is a simple example: Open a command prompt window and change the directory to wherever the batch file is located. Run the batch file and set the settings as desired. In the above example the settings are: Create a single instance of Autocad and then open the custom settings. The application name is 'Autocad'. It is also necessary to set the path to the batch file. How to use the custom settings The custom settings will be saved with each new instance of Autocad. The next time the application is run, the custom settings will be used. For example, to save the custom settings, open the Autocad application and on the File menu, select Save. Select the location for the custom settings file and the file name. To open the custom settings file, on the File menu, select Open. The custom settings are displayed. Conclusion The automated batch file I've described in this article can help anyone wishing to rapidly create multiple instances of Autodesk Autocad. The ability to create multiple instances of Autodesk Autocad using a simple batch file can greatly assist in the rapid testing of the product and any required customizations to the application.
