As an intermediate editor, some users may feel comfortable with Notepad++, but its immense power and functionalities may go over their heads. Though this may be the case for some users, those who want a simple, yet powerful tool may prefer Notepad++. Notepad++ is a multi-purpose editor, it can read and edit text files, view logs, code, HTML, XML, Javascript, Java, PHP, and many other files. It can display HTML, CSS, XML, and XHTML, but it is not suited to editing code. It is quite powerful, though. It is easy to set up, use, and set options. You can insert and delete lines, move around, find and replace text, re-order tabs, apply many formatting options, and perform common operations on large files. Note that in the newest version of Notepad++, the Visual mode is missing. That is a pity, because it was a very powerful feature. The new editor has many advanced features, and it is missing one very useful feature. For example, it does not provide support for indenting, which is the most basic code editor function. The Windows Notepad++ User Guide doesn't provide any information on this matter. It even gives the example of adding a tab, but that doesn't provide any indentation and should be removed. You can try other editors, but Notepad++ has all the basic features you may want. CuteCat's NITE is a nifty little program designed to be a free alternative to the paid Snipping Tool utility.
