Notices concerning Capitalism lab post release: Some of our features you can only view once you login to the site and one of the next releases will have a 'login' feature removed. In all other cases it is no different to 'normal' features on the site - you'll never be able to view anything except what you can see in 'normal' mode, unless you're "real" (i.e. paid) to our Members only area.Q: Best way to process hierarchical data structure using Hibernate Criteria API I am writing an application in which I am trying to write a query to get all employee names. The data structure is given below: Company has many Employees. Employee has many Projects. Project has many Employees. The query that I am using is: String query = "Select e.name FROM Employee e, Project p, Project_Worker w " + "WHERE e.project.id = p.id AND " + "w.employee.project_id = p.id AND " + "p.project_id = w.project_id "; and the results are as follows: Lets say I want to fetch all the employees whose project id is 5, here the employee with id 1 has the project id 5. So the result will be: (String) - FirstName - LastName Project Id 1 has projects with Ids 11 and 12. Project 12 has only 1 employee in it, so the result will be: (String) - FirstName - LastName Project Id 12 is not mapped to Project_Worker object,

so I don't have any employee in Project_Worker table associated with it. So the result will be: (String)
- FirstName - LastName Now Project 12 (i.e. project with Id = 12) doesn't have an employee associated with it, but I want to see it in the result,
